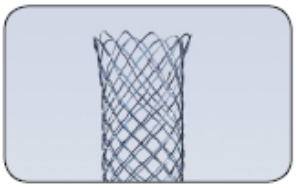
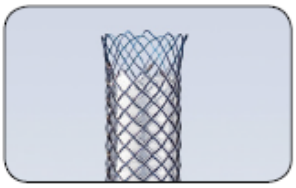
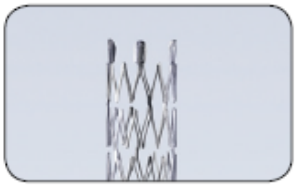
aixstent® biliary duct

percutaneous







In some cases the retrograde approach to the biliary duct (ductus choledochus) via the papilla is not possible. To address this indication, we developed a delivery system which enables a stent placement via a percutaneous technique.
A prior performed percutaneous cholangiography informes about the position and the extent condition of the stenosis in the biliary duct system. The guiding stability of the new braided delivery system guarantees a precise and reliable stent placement under endoscopic view and in fluoroscopy. The self-expandable Nitinol stents for the biliary duct in percutaneous technique are available without and with partial silicone cover.

- Stent without and with partial silicone cover
- Stent design wire woven – atraumatic ends
- Stent design laser cut – precise stent positioning
- Memory effect of Nitinol material – high radial force
- Radiopaque tantalum markers
- Percutaneous delivery system
  Length 500 mm, OTW
  Ø 2.8 mm / 8.5 French
  Accepts guide wire 0.035 inch
